

Exiv2 - Bug #512

Wrong AFPoints mapping for Canon cameras

Description

I noticed that digikam was showing invalid afpoints for photos from my Canon 350D. I've traced the problem to the exiv2 library, where the numerical data is mapped from the tags to a text string describing the af point. The mappings for the 20D (canonPiAFPPointsUsed20D) were being used for the AF points for Canon PI tag 0x0016, when they should have been using canonPiAFPPointsUsed (apart from the 20D which uses tag 0x001a). The attached patch fixes this. I've checked the online source browser and the issue still exists in 0.14
