

I don't know what a manual lens is. However if there is no metadata, nothing can be done.

Simon

I'm just having a little tidy up to see if there is anything outstanding. Just looking at this issue report, the PEF and JPG have 128 bytes in LensInfo. The DNG has 69. I think the number of bytes in LensInfo depends on the camera body. Your *ist had 36bytes, K-10 had 69 and K-3 had 128.
<http://dev.exiv2.org/issues/816#note-37>

However there's almost no data - just lots of 0's. So although there is LensInfo, I believe it's saying "I don't know anything about this Lens."

I feared so. Although comparing with [#1142](#) it seems that the camera has different LensInfo for different "I don't know anything about this Lens." cases. :) Anyway, if there is nothing to do I'm happy with keeping it closed and sorry for the noise. I'll do a couple of calibration shots for lensfun instead. :)
